FAQs

1. How do I choose the right discount rate for NPV calculations? The appropriate discount rate is the company's weighted average cost of capital (WACC) adjusted for the specific risk of the project. High-risk projects require higher discount rates.
2. What is the difference between IRR and NPV? Both are capital budgeting techniques. NPV measures the absolute value added by a project, while IRR represents the project's internal rate of return, the discount rate that makes NPV zero. While both methods generally lead to the same investment decision, NPV is preferred in cases of mutually exclusive projects with different scales.
3. How do I account for inflation in TVM calculations? Use real interest rates (nominal rate minus inflation rate) and real cash flows (nominal cash flows adjusted for inflation) to account for inflation's impact.
4. What are the key ratios used in financial statement analysis? Key ratios include liquidity ratios (current ratio, quick ratio), profitability ratios (gross profit margin, net profit margin, return on equity), and leverage ratios (debt-to-equity ratio, times interest earned).
5. How can I improve my understanding of complex financial models presented in Ross Westerfield Jordan? Practice solving problems, utilize online resources including video tutorials, and work through examples provided in the textbook. Form study groups to discuss challenging concepts and approach problems collaboratively. Consider supplementing your understanding with additional finance textbooks or online courses.
